

PLEASE PICK UP MY POOP.

Pet waste is a health risk to pets and people.

It's a nuisance in neighborhoods.

**Unless people take care of it, pet waste
enters our water with no treatment.**

pesticides

Active ingredients in pesticides can make people and animals ill. **No pesticide should be thrown in the garbage** regardless of what pest the product is designed to kill - bugs (insecticides), weeds (herbicides) or fungus (fungicide). Doing so can endanger you, your family, and your garbage hauler and may lead to contamination of the environment.

Reduction Tips

With a little effort and creativity, you can reduce or even eliminate chemical pesticides in your yard and home. Follow these tips to going pest-free the healthy way.

- **Use hand tools** to remove weeds or decide to live with a few weeds.
- **Use corn gluten meal** for crabgrass control.
- **Attract natural predators** such as ladybugs and lacewings into your garden, by planting dill, yarrow or scented geraniums. They'll eat the bugs you don't want.
- **Use natural insecticide** soaps and sprays containing garlic or hot pepper to get rid of plant munching bugs. They're available at yard and garden supply stores. Check the package for an EPA ID number and call your county to determine if the product is accepted at local drop-off facilities.
- **Remove food sources** inside your home and garage. Hungry pests like to eat bird and grass seed as well as human and pet food. Store all food in tightly sealed containers.
- **Rinse out cans and bottles** before placing them in the recycling bin.
- **Seal wall cracks** and spaces under doors to prevent pests from entering your home. Fill in space around pipes with steel wool.
- **Take garbage out often** and keep the lid on.

For more information on pest management, including non-chemical methods, visit the Minnesota Department of Agriculture's web site.
